Anti-reflux surgery is a treatment for acid reflux, also known as GERD (gastroesophageal reflux disease). GERD is a condition in which food or stomach acid comes back .

Before surgery, you'll probably get tests to check how well the muscles in your esophagus work, including esophageal manometry and esophageal motility studies. Because you're taking a risk with. Although laparoscopic anti-reflux surgery has many benefits, it may not be appropriate for some patients. Obtain a thorough medical evaluation by a surgeon qualified in laparoscopic anti-reflux surgery in consultation with your primary care physician or Gastroenterologist to find out if the technique is appropriate for you. Laparoscopic antireflux surgery (also called Nissen fundoplication) is used in the treatment of GERD when medicines are not successful. Laparoscopic antireflux surgery is a minimally-invasive procedure that corrects gastroesophageal reflux by creating an effective valve .

Overview of Fundoplication Antireflux Surgery. The most common antireflux surgery is known as a fundoplication (fundo means top of stomach and plication means to fold). Fundoplication procedures involve surgeons wrapping the upper portion of the stomach around the end of the esophagus and stitching it in place.

The goal of antireflux surgery is to restore the normal functions of the junction between the esophagus and the stomach. This is carried out by wrapping the upper portion of the stomach (the fundus) around the esophagus, either partially or totally. Anti-Reflux Surgery for the Morbidly Obese Patient. Obesity is a strong risk factor for GERD. The incidence of GERD increases as the body mass index (BMI) increases. Although still controversial, there were reports showing higher long-term failure rate for fundoplication surgery in obese patients (BMI>30). When surgical treatment of GERD is.
